Title: Angioimmunoblastic Lymphoma Presenting As Inflammatory Polyarticular Arthritis

Presenters: Kaitlyn Dalsey, DO, John Oghene, MD, Natalie Millet, DO, Anam Haija, MD

Abstract:

Polyarticular inflammatory arthritis is a common presenting symptom, especially in the outpatient setting. However, it can also be a prodrome to more rare but lethal diagnoses such as AILD. We describe the case of an adult who presented with features suggestive of a seronegative arthritis but who was found to have AILD. Results of a review of the literature and assessment of similar cases is completed highlighting the paucity of recent publications and the need for further publications and investigation.
